Application as DevOps Engineer

Dear FFW Team,

My name is Shashank Reddy Sunkara, I'm a 28-years-old Senior DevOps Engineer with over 4 years of experience in the US and India, and I'd like to take care of your applications infrastructure, deployments, security, and data compliance to contribute to the sustainable success of your DevOps platforms such as security, reliability, operational excellence, performance efficiency, and cost optimization.

I believe we're a match because DevOps and especially AWS, Jenkins, Docker & Grafana are my strong suit. In my current position with Datacultr I'm leading the DevOps team that created the complete end-to-end infrastructure from AWS platform by managing 100s of servers, and worked with multiple services like Load balancers, RDS, EFS, Backups, EBS or S3. Before that I was designing, building and testing new features for a highly scalable infrastructure as a code, CI-CD, and automation tools for Freddie Mac in the US. So, I bring a profound understanding of the entire delivery pipeline and of scalable products. I put strong emphasis on practicing best practices by following DevOps and GitOps principles and I very much enjoy working in teams.

Once going through your job description with AWS, Ansible, Docker, Gitlab, Jenkins, and Kubernetes as a tech stack, I immediately felt attracted to those. I would love to join your team in Hamburg and take a new step in my career. I am already in touch with a visa agency and could get my working visa for Germany within the next two months. In the meantime, I could also on-board remotely, starting June 27. In any case, I'll be glad to share more on the projects I have worked on and prove my skills to you. You can reach me over WhatsApp and, of course, via email as shown in the header. Thank you!

Kind regards,

Shashank Reddy Sunkara
